

ACKNOWLEDGMENT

First and foremost, I would like to express my sincere gratitude to my supervisor, **MSc Bui Trong Tung**, for his dedicated guidance, constructive feedback, and encouragement throughout this thesis. From the initial research direction to the final revision of the manuscript, his support helped me clarify the problem scope, maintain academic rigour, and complete this graduation project on schedule.

I am also deeply grateful to all the lecturers of Hanoi University of Science and Technology for the knowledge, skills, and practical orientation I received over four years of undergraduate study. Their guidance and support have been invaluable in shaping my academic journey and preparing me for the challenges of this thesis.

Finally, I owe a special debt of gratitude to my family, friends, and colleagues for their patience, trust, and encouragement during the most demanding periods of research and writing. Their support allowed me to stay focused and finish both my studies and this thesis.

Despite my best efforts, certain shortcomings may remain in this work due to time constraints and limited research experience. I sincerely welcome comments and suggestions from professors, colleagues, and friends so that I may continue to improve my knowledge and professional practice.
